ANNOTATED COMPUTER OUPUT FOR SPLIT PLOT DESIGN: BMDP 2V

by

W.T. Federer, Z.D. Feng, and N.J. Miles-McDermott

Mathematical Sciences Institute, Cornell University, Ithaca, NY

ABSTRACT

In order to provide an understanding of covariance analyses for split plot designs, analyses are first conducted on a data set without the covariate. Then an analysis with the covariate is performed. The third example has a different experiment design for the whole plots and the covariate is constant for all split plots within a whole plot. Computer packages may only give portions of the analysis correctly. Some packages require two procedural calls to obtain a portion of the correct results. BMDP 2V falls in the above category.

INTRODUCTION

This is part of a continuing project that produces annotated computer output for the analysis of balanced split plot experiments with covariates. The complete project will involve processing three examples on SAS/GLM, BMDP/2V, SPSS-X/MANOVA, GENSTAT/ANOVA, and SYSTAT/MGLH. Only univariate results are considered. We show here the results from BMDP 2V.

For Example 1, the data are artificial and were constructed for ease of computation; the experiment design for the whole plots is a randomized complete block and the split plot treatments are randomly allocated to the split plot experimental units within each whole plot. Example 2 is the same as Example 1 except that a

covariate varies from split plot to split plot. The data for Example 3 come from an experiment wherein the whole plot treatments were laid out in a completely randomized design and the split plot treatments were randomly allotted to the split plot experimental units within each whole plot. The value of the covariate varies from whole plot to whole plot but is constant for all split plots within a whole plot treatment.

We present the elementary computational steps. Simple hypothetical data are used for the first two examples so that it is easy to provide all detailed computations to illustrate how each number is obtained. Some readers may wish to skip the detailed computations. The third example comes from Winer (1971). The detailed computations are given in his book (p. 803).

Data SP-1

Split plot data with whole plots arranged in
randomized complete block design
(hypothetical data)

Block	Whole plot treatment

$$\text{Model:} \quad Y_{ijk} = \mu + \rho_j + \tau_i + \delta_{ij} + \alpha_k + (\alpha\tau)_{ik} + \epsilon_{ijk}$$

μ = mean $\qquad\qquad\qquad \tau_i$ = effect of whole plot i

ρ_j = effect of block j $\qquad \alpha_k$ = effect of split plot k

δ_{ij} = error (a) effect $\qquad (\alpha\tau)_{ik}$ = effect of interaction of

ϵ_{ijk} = error (b) effect $\qquad\qquad\qquad$ whole plot i and split plot k

Analysis of Variance

Source	(*)	df	SS
B (Blocks)	$= R(\rho\,|\,\mu,\tau,\alpha,\alpha\tau)$	2	48
W (whole plot treatments)	$= R(\tau\,|\,\mu,\rho,\alpha,\alpha\tau)$	1	24
B×W (error (a))	$= R(\delta\,|\,\mu,\rho,\tau,\alpha,\alpha\tau)$	2	16
S (split plot treatments)	$= R(\alpha\,|\,\mu,\rho,\tau,\alpha\tau)$	3	156
S×W (interaction of S and W)	$= R(\alpha\tau\,|\,\mu,\alpha,\tau,\rho)$	3	84
(**) S×B:W (error (b))	$= R(\epsilon\,|\,\mu,\alpha,\tau,\alpha\tau,\rho)$	12	112
Total (Corrected for mean)	$= R(\rho,\tau,\delta,\alpha,\alpha\tau,\epsilon\,|\,\mu)$	23	440
Mean	$= R(\mu)$	1	1176
Total (Uncorrected for mean)	$= R(\mu,\rho,\tau,\delta,\alpha,\alpha\tau,\epsilon)$	24	1616

(*)Notation follows that of Searle(1971). Since the design is balanced,
$R(\rho\,|\,\mu,\tau,\alpha,\alpha\tau) = R(\rho\,|\,\mu)$, etc. The simpler notation is used later.
(**) S×B:W means S×B within W.

Calculations of sums of squares:

$N = 2 \cdot 3 \cdot 4 = 24$, $\bar{Y} = 7$

$$R(\mu,\rho,\tau,\delta,\alpha,\alpha\tau,\epsilon) = \sum_{i=1}^{2} \sum_{j=1}^{3} \sum_{k=1}^{4} Y_{ijk}^2 = (3^2 + 6^2 + 6^2 + \cdots + 18^2 + 13^2) = 1616$$

$$R(\mu) = N\bar{Y}^2 = 24 \cdot (7)^2 = 1176$$

$$R(\rho,\tau,\delta,\alpha,\alpha\tau,\epsilon\,|\,\mu) = 1616 - 1176 = 440$$

$$R(\rho|\mu) = R(\mu,\rho) - R(\mu) = \frac{(40^2 + 64^2 + 64^2)}{8} - 1176 = 1224 - 1176 = 48$$

$$R(\tau|\mu) = R(\mu,\tau) - R(\mu) = \frac{(72^2 + 96^2)}{12} - 1176 = 1200 - 1176 = 24$$

$$R(\delta|\mu,\rho,\tau) = R(\delta,\mu,\rho,\tau) - R(\mu,\rho) - R(\tau,\mu) + R(\mu)$$

$$= \frac{(20^2 + 28^2 + 24^2 + 20^2 + 36^2 + 40^2)}{4} - 1224 - 1200 + 1176$$

$$= 1264 - 1224 - 1200 + 1176 = 16$$

$$R(\alpha|\mu) = R(\alpha,\mu) - R(\mu) = \frac{(36^2 + 42^2 + 24^2 + 66^2)}{6} - 1176 = 1332 - 1176 = 156$$

$$R(\alpha\tau|\mu,\alpha,\tau) = R(\alpha\tau,\mu,\alpha,\tau) - R(\mu,\alpha) - R(\mu,\tau) + R(\mu)$$

$$= \frac{(15^2 + 24^2 + 12^2 + 21^2 + 21^2 + 18^2 + 12^2 + 45^2)}{3} - 1332 - 1200 + 1176$$

$$= 1440 - 1332 - 1200 + 1176 = 84$$

$$R(\epsilon|\mu,\rho,\delta,\alpha,\tau,\alpha\tau) = R(\epsilon,\mu,\alpha,\rho,\delta,\tau,\alpha\tau) - R(\mu,\rho,\tau,\delta) - R(\mu,\alpha,\tau,\alpha\tau) + R(\tau,\mu)$$

$$= 1616 - 1264 - 1440 + 1200 = 112$$

Data SP-2

Data SP-2: Data SP-1 with the following covariate Z
which varies with split plot

Covariate (Z)

	whole plot

YY column is the same as in SP-1, ZZ column is computed in the same fashion. Thus, only computations for YZ column are illustrated.

$$\text{Total}_{YZ} = \sum_{i=1}^{2} \sum_{j=1}^{3} \sum_{k=1}^{4} Y_{ijk} \cdot Z_{ijk}$$
$$= 3(1) + 6(2) + \cdots + 14(4) + 18(4) + 13(7) = 537$$

$$\text{Mean}_{YZ} = N\bar{Y}... \bar{Z}... = \frac{168 \cdot 60}{24} = 420$$

$$B_{YZ} = \frac{\sum\limits_{j=1}^{3} (\sum\limits_{i=1}^{2} \sum\limits_{k=1}^{4} Y_{ijk})(\sum\limits_{i=1}^{2} \sum\limits_{k=1}^{4} Z_{ijk})}{2 \cdot 4} - 420 = \frac{40(14) + 64(20) + 64(26)}{8} - 420$$
$$= 438 - 420 = 18$$

$$W_{YZ} = \frac{\sum\limits_{i=1}^{2} (\sum\limits_{j=1}^{3} \sum\limits_{k=1}^{4} Y_{ijk})(\sum\limits_{j=1}^{3} \sum\limits_{k=1}^{4} Z_{ijk})}{3(4)} - 420 = 432 - 420 = 12$$

$$B \times W_{YZ} = \frac{\sum\limits_{i=1}^{2} \sum\limits_{j=1}^{3} (\sum\limits_{k=1}^{4} Y_{ijk})(\sum\limits_{k=1}^{4} Z_{ijk})}{4} - 438 - 432 + 420$$

$$= 454 - 438 - 432 + 420 = 4$$

$$S_{YZ}: \quad \sum\limits_{k=1}^{4} \frac{(\sum\limits_{i=1}^{2} \sum\limits_{j=1}^{3} Y_{ijk})(\sum\limits_{i=1}^{2} \sum\limits_{j=1}^{3} Z_{ijk})}{2(3)} - 420 = 453 - 420 = 33$$

$$S \times W_{YZ}: \quad \frac{\sum\limits_{i=1}^{2} \sum\limits_{k=1}^{4} (\sum\limits_{j=1}^{3} Y_{ijk})(\sum\limits_{j=1}^{3} Z_{ijk})}{3} - 453 - 432 + 420$$

$$= 498 - 453 - 432 + 420 = 33$$

$S \times B : W_{YZ}$:

$$\sum\limits_{i=1}^{2} \sum\limits_{j=1}^{3} \sum\limits_{k=1}^{4} Y_{ijk} Z_{ijk} - 454 - 498 + 432$$

$$= 537 - 454 - 498 + 432 = 17$$

Analysis of Variance and Covariance

Source		df	SS
B (block)	$= R(\rho \mid \mu, \tau)$	2	48
W (whole plot treatment)	$= R(\tau \mid \mu, \rho, \beta_1)$	1	3.4286
Regression (a)	$= R(\beta_1 \mid \mu, \rho, \tau)$	1	16.0
B×W (error (a))	$= R(\delta \mid \mu, \rho, \tau, \beta_1)$	1	0.0
S (split plot treatment)	$= R(\alpha \mid \mu, \rho, \tau, \alpha\tau, \beta_2)$	3	84.243
S×W (interaction of S and W)	$= R(\alpha\tau \mid \mu, \rho, \tau, \alpha, \beta_2)$	3	37.474
Regression (b)	$= R(\beta_2 \mid \mu, \rho, \tau, \alpha, \alpha\tau)$	1	14.450
S×B: W (error (b))	$= R(\epsilon \mid \mu, \rho, \alpha, \tau, \alpha\tau, \beta_2)$	11	97.550

$$\hat{\beta}_1 = B \times W_{YZ} \,/\, B \times W_{ZZ} = 4/1 = 4$$

$$\hat{\beta}_2 = S \times B : W_{YZ} \,/\, S \times B : W_{ZZ} = 17/20 = 0.85$$

The SS's adjusted by regression on Z are illustrated below:

$R(\rho|\mu) = 48$, remains same since it is not of interest to adjust for Z on the blocks.

$$R(\tau,\delta|\mu,\rho,\beta_1) = (W_{YY} + B{\times}W_{YY}) - \frac{(W_{YZ} + B{\times}W_{YZ})^2}{W_{ZZ} + B{\times}W_{ZZ}}$$

$$= (24 + 16) - \frac{(12 + 4)^2}{6 + 1} = 40 - \frac{256}{7} = 3.4286$$

$$R(\delta|\mu,\rho,\tau,\beta_1) = B{\times}W_{YY} - \frac{(B{\times}W_{YZ})^2}{B{\times}W_{ZZ}} = 16 - \frac{4^2}{1} = 0$$

$$R(\tau|\mu,\rho,\beta_1) = R(\tau,\delta|\mu,\rho,\beta_1) - R(\delta|\mu,\rho,\tau,\beta_1)$$

$$= 40 - \frac{256}{7} - 0 = 3.4286$$

$$R(\beta_1|\mu,\tau,\rho) = \frac{(B{\times}W_{YZ})^2}{B{\times}W_{ZZ}} = \frac{4^2}{1} = 16$$

$$R(\alpha,\epsilon|\mu,\rho,\tau,\alpha\tau,\beta_2) = (S_{YY} + S{\times}B{:}W_{YY}) - \frac{(S_{YZ} + S{\times}B{:}W_{YZ})^2}{S_{ZZ} + S{\times}B{:}W_{ZZ}}$$

$$= (156 + 112) - \frac{(33+17)^2}{9+20}$$

$$= 268 - 86.207 = 181.793$$

$$R(\alpha\tau,\epsilon|\mu,\rho,\alpha,\tau,\beta_2) = (S{\times}W_{YY} + S{\times}B{:}W_{YY}) - \frac{(S{\times}W_{YZ} + S{\times}B{:}W_{YZ})^2}{S{\times}W_{ZZ} + S{\times}B{:}W_{ZZ}}$$

$$= 84 + 112 - \frac{(33+17)^2}{21+20} = 196 - 60.976 = 135.024$$

Note: $R(\alpha,\epsilon|\mu,\beta_2)$ and $R(\alpha\tau,\epsilon|\mu,\alpha,\tau,\beta_2)$ are intermediate steps for later use.

7

$$R(\beta_2 \mid \mu,\rho,\alpha,\tau,\alpha\tau) = \frac{(S \times B:W_{YZ})^2}{S \times B:W_{ZZ}} = \frac{17^2}{20} = 14.450$$

$$R(\epsilon \mid \mu,\rho,\alpha,\tau,\alpha\tau,\beta_2) = S \times B:W_{YY} - \frac{(S \times B:W_{YZ})^2}{S \times B:W_{ZZ}} = 112 - \frac{17^2}{20} = 112 - 14.45 = 97.55$$

$$R(\alpha \mid \mu,\rho,\tau,\alpha\tau,\beta_2) = R(\alpha,\epsilon \mid \mu,\rho,\tau,\alpha\tau,\beta_2) - SS \text{ error } b = 181.793 - 97.55$$
$$= 84.243$$

$$R(\alpha\tau \mid \mu,\rho,\alpha,\tau,\beta_2) = R(\alpha\tau,\epsilon \mid \mu,\rho,\alpha,\tau,\beta_2) - R(\epsilon \mid \mu,\rho,\alpha,\tau,\alpha\tau,\beta_2)$$
$$= 135.024 - 97.55 = 37.474$$

Data SP-3

Split plot data with plots arranged in a completely randomized design and a covariate Z that is constant within the whole plot. (Winer, 1971, p. 803)

0.20000	1.000		
3.00000	0.000	1.000	
16.80000	-0.327	-0.945	1.000

SPHERICITY TEST APPLIED TO ORTHOGONAL COMPONENTS - TAIL PROBABILITY   0.0000

Tests assumption that the orthogonal components for the split plot, SUBPLOT are
independent and have equal variances (sometimes referred to as symmetry assumption)
The above information on the orthogonal components of the split plots are useful when
the levels of the split plot are ordered and the investigator is concerned about the
assumption of independence and equal variances on the levels of the split plot.
However, it will be shown on SP-1 page 5 that the "error 2" or SSE(b) that BMDP computs
for this design is incorrect making the above values also incorrect.

ANALYSIS OF VARIANCE FOR 1-ST

DEPENDENT VARIABLE – Y1   Y2   Y3   Y4

	SOURCE	SUM OF SQUARES	DEGREES OF FREEDOM	MEAN SQUARE	F	TAIL PROB.	GREENHOUSE GEISSER PROB.	HUYNH FELDT PROB.
	MEAN $\;SSM=N\bar{Y}^2=24(7)^2$ =	1176.00000	1	1176.00000	147.00	0.0067		
	BLOCK $R(\rho\mid\mu)$	48.00000	2	24.00000	3.00	0.2500		
	WHOLE $R(\tau\mid\mu)$	24.00000	1	24.00000	3.00	0.2254	$3.0 = 24.0/8.0$	
1	ERROR $R(\delta\mid\mu,\rho,\tau)$	16.00000	2 MSE(a)	8.00000				
	SUBPLOT $R(\alpha\mid\mu)$	156.00000	3	52.00000	15.60	0.0031	0.0544	0.0031
	SB	92.00000	6	15.33333	4.60	0.0428	0.1719	0.0428
	SW $R(\alpha\tau\mid\mu,\alpha,\tau)$	84.00000	3	28.00000	8.40	0.0144	0.0964	0.0144
2	ERROR incorrect → see note below	20.00000	6	3.33333				

The "2 error" or SSE(b) reported here is incorrect. This means that Greenhouse-Geisser & Huynh-Feldt are adjusted p-values to be used when the symmetry assumptions on the split plot are not met (see sphericity test on SP-1 page 3). However, these values are incorrect for this design because BMDP has computed the SSE(b) incorrectly. See the note below.

The "2 error" or SSE(b) reported here is incorrect. This means the F statistics and associated tail probabilities for the split plot portion of the analysis are also incorrect. To obtain the correct SSE(b) it is necessary to pool the SS's labelled SB(SUBPLOT*BLOCK) with the SS's labelled "Z error". I.E. 92+20 = 112. The F statistics for SUBPLOT(F) and SW(SUBPLOT*WHOLE) need to be recalculated using this corrected SSE(b).

16

POOLED REGRESSION COEFFICIENTS → The BMDP manual states that this estimate is "obtained from the weighted pooled cross-product matrix"
    ... and is used to compute adjusted cells means". This is probably of no interest to the experimenter.

1-ST COVARIATE	4.00000

The "2 error" or SSE(b) reported here is incorrect. This causes the SS's for the covariate in the above analysis to be incorrect also, thereby causing the SS's for SUBPLOT and SUBPLOT*WHOLE labelled (SW) to be adjusted incorrectly. The reason "2 error" or SSE(b) is wrong is because the SS's for SUBPLOT*BLOCK (labelled SB) should be pooled with "2 error". Another call to BMDP is required to get the correct split plot portion of the analysis and this begins on SP-2 page 8.

ADJUSTED CELL MEANS ARE NOT COMPUTED WHEN THE INCLUDE OPTION IS USED. → BMDP cannot compute adjusted means for anything other than straight factorials.

CPU TIME USED   0.213 SECONDS

P0 and R0 are whole plot predicted values and residuals, respectively. P1-P4 and R1-R4 are supposed to be split plot predicted values and residuals but are computed from an incorrect value for SSE(b) (see previous page) and should therefore be ignored (correct values are computed in the run that follows).

1	97.55000	97.55000	0.00000

ADJUSTED CELL MEANS ARE NOT COMPUTED WHEN THE INCLUDE OPTION IS USED.

CPU TIME USED   0.216 SECONDS

NOTE: If the correct error SSE(b) sums of squares are to be obtained, we need to use the line "EXCLUDE IS 13,123." However, this does not allow the means to be adjusted for covariance. If the above statement is deleted from the program, adjusted means will be obtained but they are incorrect because SSE(b) is computed incorrectly.

1	61.29820	61.29820	0.00000
2	6.37500	6.37500	0.00000

ADJUSTED CELL MEANS FOR 1-ST DEPENDENT VARIABLE

A		= *1.00000	*2.00000
	B		
Y1	1	14.63323	18.36677
Y2	2	10.38323	13.36677

The means $\bar{Y}_{1\cdot k}$ are adjusted only for the whole plot covariate because the covariate is constant for all split plots within one whole plot. The formula for adjusting $\bar{Y}_{1\cdot k}$ means is

$$\bar{Y}_{1\cdot k}\ \text{adj} = \bar{Y}_{1\cdot k} - \hat{\beta}_1(\bar{Z}_{1\cdot\cdot} - \bar{Z}_{\cdots})$$

An example for $\bar{Y}_{1\cdot 1}$

$$\bar{Y}_{1\cdot 1}\ \text{adj} = 14.25 - 1.02(4.5 - 4.9)$$
$$= 14.63$$

P0 and R0 are whole plot predicted values and residuals, respectively. P1-P2 and R1-R2 are split plot predicted values and residuals.

$$Y_{ijk} = P0 + R0 + Pj + Rj$$

e.g. $Y_{111} = 10.59208 - 1.59208 + 2.125 - 1.125 = 10.00$
